

STCs credit information sheet

Small-scale technology certificates (STCs) is an indicator of how much renewable energy a system can generate, and Eurosun products are among the highest rated systems available.

The Australian Government Clean Energy Regulator (CER) is responsible for publishing a Register of Solar Hot Water heaters for which STCs are recorded under the provisions of the Renewable Energy Act 2000.

The number of STCs depends on three factors: 1) Date of the installation of the system; 2) Geographic location of the property/building and 3) The awarded number that correlates to the overall efficiency of the product.

Eurosun Hot Water systems have been awarded amongst the highest STCs in Australia, which is a statement to the efficiency and quality of its units.

The regulator has determined 4 STCs zones with each zone being defined based on climate and solar radiations levels due to the geographic locations. Additionally, there is a record of the STCs generated by main accredited solar HWS brands in the market.

The map below shows the geographic location of each zone.
